- Следствие въздействие от лошото време (килево и бордово клатене) , ударите върху лапите на котвата , корпуса и баковата част се скъсва осигурителната проволка в долната част на талрепа .
- В допълнение на това настъпва приплъзване на няколко звена в следствие на отместване от фиксираното положение на гилотината , създаващ допълнителен луфт от приспуснатото положение от попоходно на котвата. Бива преодоляно и възпиращото въздействие на допълнително поставения заключващ бар през звено към веригата , който е бил
- V-деформиран и прекаран през котвения клюз . следи от което се виждат в същия.
- Всичко това води до постепенно преодоляване на спирация ефект на и на лентовия спирач.
- Започва постепенно изтичане на веригата на лява котва през клюза в следствие на ускоряващата маса на котввата заедно с частта от изтеклата верига.
